stratified by the stage of disease. RESULTS: Annual outpatient costs per patient were €694,877, and US$1,409 for Qingdao, Nanjing, and Beijing, respectively. Among out-patient expenses, western medications formed the bulk of these costs in Qingdao (38.9%) and Beijing (62.9%), but a lesser amount in Nanjing (46.9%). The use of antivenom was 37% in Beijing and 17% in Qingdao of total western medications. TCM prescriptions for CHB varied across these different cities with the greatest usage in Nanjing (20.8%). For hospitalized patients, annual costs per patient were €1,893, 2,101, and US$2,622 in Nanjing, Qingdao, and Beijing, respectively. The costs increased progressively in patients with compensated liver disease, (US$1983) decompensated liver disease (US$2,802) and hepatocellular cancer (US$3,919), respectively. Patients contributed around 50% towards outpatient costs and 30% towards inpatient care. CONCLUSIONS: CHB exerts a significant health and financial burden which progressively increases as patients progress from early to late stages of the disease. While antivirals are associated with a reduction in disease progression, their use remains relatively low in urban areas in China. Further work is required to determine whether an early treatment with effective CHB medications can reduce the overall financial burden within China.

BURDEN OF PEDIATRIC INFLUENZA IN EUROPE: A GAP ANALYSIS

Ricciottali C, Heafa I, Laaserwerthamp O, Moore S

RTI Health Solutions, Manchester, UK, Medmimune, Cambridge, Cambridgehire, UK, Medimimune, LA, Gerbson, MD, USA

OBJECTIVES: Outbreaks of influenza often incur a substantial burden in terms of health care costs and patient days. RESULTS: This study was to identify gaps in available data related to the economic burden of influenza in children in the UK, Germany, Italy, Spain, France, Sweden, The Netherlands, Finland, and Austria. METHODS: A structured literature search (1970-March 2009) involving PubMed, EMBASE, and the Cochrane Library defined the basis of the gap analysis. Articles were excluded if not related to influenza and not reporting resource use, cost, absenteeism or utility data in a country of interest for a group ≤18 years. A total of 171 articles were short-listed for full-text review, and data extracted from 43. RESULTS: Available published data suggests a significant burden of influenza in children. Most studies reporting health care utilization (31 of 32) focused on hospitalization, clinician visits, and prescription of antibiotics, antipyretics, or analgesics. Regarding cost burden of influenza the number of studies specifically related to the pediatric population is very small, and to our knowledge, only one study quantified the indirect costs caused by influenza in children. CONCLUSIONS: Existing information suggests a significant burden of influenza in children. Burden information across reviewed EU countries is incomplete and fragmented. A multinational data collection initiative providing a complete and age-stratified picture of the burden of influenza in children appears warranted.

BURDEN AND COST OF SNAKEBITE ENVENOMING: ANTIVENOM OUT OF REACH!

Aggarwal A, Pathak P, Thakur D

Heran Health Private Ltd, Chandigarh, India

OBJECTIVES: Anti-venom is the only specific treatment to prevent neurological dis- orders, amputation and death in snakebite envenoming, categorized as neglected tropical disease by WHO. Majority of victims are young and economically productive. Hence, the economic impact of their disability is considerable. We reviewed the burden and health care costs associated with snakebite envenoming: its incidence, morbidity and mortality, and the access to anti-venom treatment. METHODS: The information was retrieved from 1985-2009 from MEDLINE, Google Scholar and WHO website with search terms including “snakebite”, “anti-venom”, “cost of anti-venom” and “snakebite morbidity and mortality”. RESULTS: Snakebite as a tropical disease causes considerable morbidity and mortality worldwide with global annual estimates for 2007 ranging from 1,200,000–5,500,000 for snakebite incidence to 42,100,000–1,841,000 and 20,000–94,000 for envenoming and deaths respectively. South Asia (121,000) has the highest number of envenoming followed by Southeast Asia (111,000) and east-Sub-Saharan Africa (43,000). The price of anti-venom has typically risen by 10 fold over the last 20 years. For example, the costs to Australian hospitals of CSL polyclonal and taipan antivenoms were A$1833 and A$1577 in 2003 as compared to A$300 and A$245 in 1985, respectively. The number of anti-venom vials increases with severity (upto 5, 94,000 for envenoming and deaths respectively. South Asia (121,000) has the highest number of studies specifically related to the pediatric population is very small, and to our knowledge, only one study quantified the indirect costs caused by influenza in children. CONCLUSIONS: Existing information suggests a significant burden of influenza in children. Burden information across reviewed EU countries is incomplete and fragmented. A multinational data collection initiative providing a complete and age-stratified picture of the burden of influenza in children appears warranted.

ANNUAL COSTS OF CHRONIC HEPATITIS B DISEASE STATES IN PORTUGAL

United BioSource Corporation, Barcelona, Spain, 1Hospital Santa Maria, Lisbon, Portugal, 2Hospital de Santo António, Porto, Portugal, 3Hospital Santo António dos Capuchos, Lisbon, Portugal, 4Hospital da Universidade de Coimbra, Coimbra, Portugal, 5Hospital Egas Moniz, Lisbon, Portugal, 6Hospital Público Valente, Lisbon, Portugal, 7Hospital de S. Marcos, Braga, Portugal, 8Escola Nacional de Saúde Pública, Lisbon, Portugal

OBJECTIVES: Despite a significant decrease over the last 20 years, the prevalence of hepatitis B remains high in Portugal (an estimated 36,000 cases in 2002). Hepatitis B represents a relevant public health issue due to its dramatic consequences when it turns chronic, namely the associated risk of cirrhosis and hepatocellular carcinoma. The aim of this study was to estimate annual cost of disease states associated with chronic hepatitis B (CHB) from the perspective of Portuguese NHS. METHODS: We estimated the resource use to treat CHB and its disease states, namely Compensated Cirrhosis (CC), Decompensated Cirrhosis (DC), Hepatocellular Carcinoma (HCC) and Liver Transplantation follow-up (LT). A panel of 8 specialists from Portuguese NHS hosi-

POOR ADHERENCE TO TREATMENT WITH PEGYLATED INTERFERON/ Ribavirin IN PATIENTS WITH CHRONIC HEPATITIS C INFECTION IS ASSOCIATED WITH GREATER HEALTH CARE COSTS

Buran RW, Bhor M, Laitinen D, Ducci B

Abbott Laboratories, Inc, Abbott Park, IL, USA, Abbott Laboratories, Abbott Park, IL, USA, Abbott GmbH & Co., Ludwigsafen, Germany

OBJECTIVES: Poor adherence is a serious issue in the management of patients with chronic hepatitis C (CHC) owing to the difficulty of treatment with pegylated interferon/ribavirin (Peg-IFN/RBV). Future small molecule treatments may obviate difficulties of Peg-IFN/RBV therapy. We analyzed cohorts of CHC patients treated with Peg-IFN/RBV to quantify the impact of medication adherence on health care costs over 4 years follow-up. METHODS: A retrospective claims analysis was performed from January 1, 2001 through December 31, 2007 using the Medstat MarketScan database. Inclusion criteria: 1) CHC diagnosis; 2) Peg-IFN/RBV treatment in 2002 (index); and 3) continued for greater than 24 weeks from index. Continuous enrollment from 6 months prior to index (baseline) to 48 weeks after index (follow-up) was required. Patients were excluded if they had a diagnosis of HIV or HBV. Adherence was defined by medication possession ratio (MPR), days with Peg-IFN/RBV divided by 336 days or 48 weeks. Overall Medical and Pharmacy costs were compared between adherent (MPR ≥ 80%) versus non-adherent patients (MPR < 80%), controlling for age, gender and baseline costs. RESULTS: A total of 1173 patients met study inclusion criteria (adherent, n = 319; non-adherent, n = 854). The majority of patients were male (64.5%); the mean age was 47 years. Univariate analysis revealed that Overall Medical, ER, Inpatient and Outpatient Hospitalizations, and Pharmacy costs were significantly greater in non-adherent compared to adherent patients. Multivariate analysis confirmed these results (difference in mean; 95% CI) for Overall Medical ($10,006; 1530–18,492) and Outpatient Hospitalization ($3,024; 553–5,494) costs. CONCLUSIONS: Medication non-adherence to Peg-IFN/RBV treatment was associated with greater health care costs. These results may be due to decreased Sustained Viral Response associated with low adherence. Treatment with future small molecules may potentially improve adher- ence and reduce costs.
